

### Automatic liquid vending machine:

In this assignment, you will develop a PLC program and an HMI for an automated vending machine that may be used for selling liquids like milk, mineral water, soft drinks, tea/coffee, and the like.

We will assume that the minimum volume that you can buy is **500ml**. Thereafter, you can change the volume in multiples of **100ml** and the maximum volume you can buy is **5.0 litres**.

#### Inputs:

- **Increase** and **Decrease** momentary contact push buttons to adjust the volume to be purchased in the **Set Mode**.
- A **Litre\_mL** push button to adjust the resolution with which the volume can be set. In the 'Litre' position, each press of the **Increase** or the **Decrease** push button changes the volume by one litre. While in the 'mL' position, the volume changes by 100 mL for each press of the **Increase** or the **Decrease** push button.
- **Dispense** - a momentary contact push button, that starts the dispense mode.
- **The Hold** momentary contact push button is used to temporarily stop dispensing the liquid, while in the dispense mode. This is useful if you want to collect the liquid being dispensed in multiple containers.

#### Outputs:

- A digital indicator to display the set volume of liquid (in litres).
- A second digital indicator to display the volume of the liquid (in litres) to be dispensed, while in the **Dispense Mode**.
- An indicator called "**Limit reached**" lights up for one second whenever the **Increase** push button is pressed when the Set Volume is 5 litres or the **Decrease** push button is pressed when the Set Volume is 500 mL.

#### Mode for operation:

- a. The vending machine is normally in the "**Set mode**" where you can define the amount of liquid that you want to buy. You can set the volume (from 0.5

litre to 5.0 litre, in steps of 0.1 litre) using the **Increase**, **Decrease** and the **Litre\_mL** push buttons. Pressing the **Increase** button when the volume is 5 litres does not affect the volume; it remains at 5 litres. The “**Limit reached**” indicator lights up for one second. Similarly, pressing the decrease button when the volume is 500 mL does not affect the volume and the “**Limit reached**” indicator lights up for one second.

- b. After the desired volume has been set, the user presses the **Dispense** push button, which puts the machine in the **Dispense Mode**. In this mode, the machine dispenses the selected volume of liquid. Ideally, a high-accuracy flowmeter measures the dispensed volume. However, since we do not have a flowmeter, in this assignment the dispensed volume is assumed to be proportional to the time interval for which the liquid is dispensed. **We will assume that it takes 400 milliseconds to dispense 100 ml of liquid.**
- c. As mentioned earlier, a second digital indicator displays the volume of the liquid that is yet to be dispensed in steps of 0.1 litres. Initially, this is equal to the volume of the liquid that is set, in the Set Mode. Once dispense begins, the indicated volume decreases by 100 mL every 400 milliseconds, until the displayed volume becomes equal to zero, i.e., there is no more liquid to dispense. (In a practical system pushing the dispense button will activate a pump or an electrically operated valve (solenoid valve) causing the desired volume of liquid to be dispensed.)
- d. In the Dispense mode, the second indicator that displays the volume of the liquid that is yet to be dispensed has a **green coloured** background that indicates that the **Dispense mode is active**. The background of the digital indicator is **red when the Set or Hold mode is active**.
- e. The Set Volume defined in the Set Mode (i.e., before the start of the Dispense mode) **cannot be changed** while in the Dispense mode. The **Increase** and **Decrease** and the **Litre\_mL** push buttons are inactive (i.e. operating them has no effect) during the Dispense mode.
- f. After the Set Volume is dispensed, the machine automatically switches back to the Set Mode and a new Set volume can now be defined.

- g. A **Hold** push button can be pressed during the dispense mode, which temporarily stops dispensing the liquid until the **Hold** push button is pressed again to resume dispensing the remaining volume of liquid. This may be useful to change containers collecting the liquid being dispensed. The **Hold** push button is inactive during the set mode.

Q: In the diagram shown below:

- What will be the output of the timer when start = true?
- Is the timer output synchronised with the rising edge of start?
- What happens if start = false?

The design of the HMI is left to the creative genius in you. The various modes of the machine such as SET, Dispense, HOLD, etc. should be indicated as digital readouts and not as indicators. You can do this, for example by writing the text “SET” using Visualization Toolbox > Common Controls > Label and assigning a suitable variable to its attribute Properties > State Variables > Invisible, so that the label “SET” is visible only when relevant. Also, ensure that the function of all push buttons and switches used is labelled, and nothing is left to the imagination.
